

Long Range Identification and Fleet Management Solutions

Deister Electronic's tranSpeed and proxSafe RFID solutions provide complete access control identification whether accessing a vehicle, restricted lanes, or managed parking. When integrated with fleet management software they can automate vehicle assignment, provide real-time availability, record visits to service areas, and balance vehicle assignment based on utilization and maintenance schedules.

Deister's durable and dependable RFID technologies can be applied in many ways to reduce administration, increase accountability, maximize asset lifetime, manage vehicle access and mobile devices for your drivers.

tranSpeed[®] Long Range Vehicle Identification

Deister Electronic's tranSpeed Long Range Identification provides quick access to authorized vehicles. Whether you're protecting restricted entries or managing staff parking, tranSpeed will help prevent patient and guest traffic from interfering with hospital operations.

- Restrict vehicle access in emergency areas
- Manage staff parking access
- Monitor arrivals and departures of ambulance and service vehicles

proxSafe[®] Vehicle Key Management

With proxSafe Key Management, you can assign vehicles, track utilization, and simplify administration of vehicle keys. Key Management systems help ensure keys to ambulances and other service vehicles are available when needed. You can also set curfews and alerts on keys to enforce return policies.

Manage Radios and Other Mobile Devices

Add proxSafe Smart Storage to your fleet management solution to make securing and retrieving fobs, radios, and other mobile devices convenient for your drivers. Assign, charge, and secure devices dependably with proxSafe.

- Easily manage vehicle keys, radios, and mobile devices used by your drivers
- Centralized management and self-service capabilities
- Integrates with Fleet Management and Physical Access Control Systems
- Charge your radios and mobile devices where you secure them, always ready when you need them

tranSpeed® Long Range Vehicle Identification

Identify Vehicles Reliably – Long-Range Identification Made Simple

The fast and reliable long-range identification solution automatically identifies both drivers and vehicles in any weather conditions. Congested lines at vehicle entry and exit areas are a thing of the past. tranSpeed is ideal for car parks, traffic management and free-flowing vehicle access control (AVI). The technology is also suitable for monitoring rail traffic as well as vehicle access barriers in city centers, airports and

at toll roads. Thanks to numerous interfaces it is possible to integrate tranSpeed seamlessly into other control systems – but it can also be used as a stand-alone solution. There is a wide range of transponders available; these include robust heavy-duty transponders, self-adhesive stickers for windscreens and ISO cards, which perfectly combine two reader technologies.

us.deister.com/johnsoncontrols

Security

A specially developed vignette/sticker function in combination with deister's "smart frame" ensures data security as well as protection against manipulation.

Dual Technology

Combine vehicle and person access control systems in a single card within the same transponder and achieve maximum range.

Intuitive Guidance

Large LEDs and unambiguous signal tones give the user distinctive visual and audible feedback.

Plug & Play

The compact design including integrated antennas means it is possible to connect standard power and data lines to the readers by means of a single connector.

Test Instead of Trial and Error

The so-called POC makes the field strength visible at every position. That makes it child's play to find the best position for the transponder.

Made in Germany

All products are made in Germany. Their function and quality are developed, produced and tested to the highest standards.

tranSpeed® Long Range Vehicle Identification Components

Self-adhesive with vignette/sticker function

In addition to the encrypted deister "smart frame" for data security, the windscreen transponder for vehicles identification features a vignette/sticker function; this is an additional safety measure to prevent the transponder being torn off.

The specially developed antenna facilitates optimum ranges through the windscreen as far

as 7 m using a TSU 200 reader. To achieve a constant range in conjunction with different vehicle types the transponder is also equipped with a function to adapt the range. For instance, RRD stickers are affixed to the marked positions. This function makes it possible to reduce the identification range by either 66% or 33%. That ensures it is possible to identify different types of vehicles at the same distance to the reader.

POC Makes RFID fields visible — When installing a UHF long-range identification system the challenge is always to place the readers and transponders in the best possible position to ensure all vehicles are reliably detected. The POC (patent pending) represents an optimum solution to the challenge.

POC behaves precisely the same as a transponder. The integrated LEDs display the available level of communication at every position in the field between the reader and transponder. Finding the best possible position

for the transponder is quick and effective. The POC is available for both passive and active transponders.

TSU reader series (Passive long-range identification) — TSU UHF readers include incredibly robust die-cast aluminum housing for a compact design with integrated antenna. The TSU200 boasts an upper range of 22 feet and the TSU100 with a range of 10 feet.

The tranSpeed portfolio of passive transponders has been specifically developed for different materials to ensure it is also possible to achieve the best-possible range on glass or metal. The special layout (patent pending) of the antenna integrated with the ISO card means it can be carried either way round as well as close to the body (unlike most UHF transponders) without impairing the range. Dual technology cards are also available with near field and long range credentials combined for increased operational efficiency.

TAL 700 reader (Active long-range identification) — The TAL 700 generates an adjustable identification field that will penetrate most RF shielding materials. This active system is particularly suitable for applications in which it is necessary to identify vehicles at an unfavorable angle to the reader – or the windshields are covered with a special film to protect against the sun

or for reasons of passenger privacy. With a range of up to 22 feet, the TAL 700 is suitable for all typical applications such as parking-space management and vehicle access control at car park barriers.

The active transponder TPA 8014 has an ISO card format and a battery life of up to two years and the commonly available battery can be replaced by the owner to reduce costs. The transponders can also be equipped with an additional near field credential technology. That makes it possible to use the TPA 8014 in a combined vehicle and PACS application.

Controller — The tranSpeed system is rounded off by controllers such as the IDC 2. The control unit is top-hat rail compatible and provides encrypted interfaces for tranSpeed readers and dry contact relays for vehicle access and exit barriers as well as light signal control systems. Configuring authorization levels is made easy with the software "Commander Connect," which is connected to the IDC 2 via an IP interface.

Converter — Interface converters are able to convert data received from a reader to a different format or protocol as well as to integrate tranSpeed components into an existing system. The deBUS protocol is used to encrypt communication on the input side. Wiegand, Data/Clock, Magstripe, RS232 and RS485 interfaces are supported on the output side by several customer-specific protocols.

Johnson Controls — Authorized Value Added Reseller

deister electronic Value Added Resellers provide comprehensive solutions, incorporating deister's innovative technologies into your overall security and asset management solutions. Whether you are looking to integrate your deister solution with an existing Physical Access Control System, or operate as a standalone system, Johnson Controls can help you get the most from your investment.
