true power
of keys

Commander Connect Software
for proxSafe key management systems

proxSafe®

is an intelligent key and asset management solution for monitoring the location of keys and assets including vehicles, weapons, tablets and test equipment. As a complement to a more expensive per-door access control solution, proxSafe provides unmatched situational awareness.

software modules

FLEETS

- Fleet Management
- License Check
- Transaction Info

RESERVATIONS

- Easy Reservation
- keyTag Reserve by Time

ADVANCED SECURITY

- 4 & 6 Eyes Principle
- Secure Return
- Department Release
- keyTag Time Profiles with Email Alarmer
- Special Reports

GROUPS

- Issue Code Logging
- Roaming keyTag
- Immediate or Configurable Group Release
- One-time & Single User keyTag Assignments

REPORTS

- CSV Export
- Alarmer
- Inconsistent Returns
- Reservations via Key Cabinet GUI

ALARMER

- Starts Another App

Commander Connect

Commander Connect is the intuitive central management software driving the proxSafe key management solution. Its unique web-based interface allows you to control permissions, configure operational parameters, and gives you complete visibility of who has access to keys and assets, where those keys are at any time, and when they need to be returned.

With its flexible license model and scalable, modular approach, you can easily expand your system at any time to meet changing requirements while enforcing strict security in vulnerable areas such as drug cabinets, chemical closets, valet kiosks, casino cash carts, and more.

fleet

Module Highlights:

For customers managing a fleet of trucks, cars or other vehicles, our Fleet Module helps you track and control your entire vehicle inventory, maintenance, vehicle mileage status and accident history, driver assignments, important dates and more — all in one place.

FLEETS

- Fleet Management
- License Check
- Transaction Information

Our modern, web-based software approach simplifies the complex challenge of managing vehicles and fleets. Whether you have 5 or 25,000 vehicles, you can leverage our modular approach and add functionality as your business needs change.

Monitor drivers' licenses to ensure the correct vehicle is matched to an approved driver, and use in conjunction with an HR or ERP system that will flag any training needs or driving infractions that may need to be addressed before approving vehicle assignment. You can also reserve vehicles and release a group of vehicle keys based on a wide range of criteria...random, least mileage, longest retention period, etc. Plus, the powerful roaming key feature lets you transfer keys and assets to different areas and cabinets - saving time when fleets are located across massive, adjacent lots.

Preventing fleet downtime is essential and there are 999 fault codes that can provide vital data to help you proactively service vehicles to prevent expensive fleet interruption. "Non-critical" codes indicate conditions like low tire pressure, chipped windshield, etc. and do not prevent a user from taking a vehicle, while "critical fault" codes indicate serious issues like blown engine, broken suspension, etc. These critical codes will automatically lock the key inside the box until either an administrator or designated person, such as a mechanic, takes action.

reservations

Module Highlights:

Reserving keys or other assets is a great way to manage who has access to assets, vehicles or rooms and for how long. Our comprehensive Reservations Module lets you and your staff set specific conditions including time-specified reservations, email notifications, and mobile reservations.

RESERVATIONS

- [Easy Reservations](#)
- [Reserve by Time Specification](#)

The Reservations Module give you extremely detailed control over who has access to keys and assets. Use the Easy Reservation and keyTag Reservation Time Spec features to reserve keys and send email notifications containing the keyTag identification, cabinet location and date and time a key must be returned.

You can even reserve a group of keys - a very useful feature for any business that may need to provide temporary facility access to a group of contractors, provisional workforce, or entire department. The powerful roaming key feature lets you transfer keys and assets across multiple locations, making proxSafe an ideal solution for sprawling campuses or widespread office parks while still maintaining the integrity of the original reservations. The module can be used on your PC or with proxSafe Mobile, our intuitive mobile app that lets you manage reservations from your smart device to increase efficiency and awareness.

For the ultimate in accountability, you can generate reports as a graphical representation of the proxSafe key cabinet, complete with highlighted key slots indicating where keys may still be outstanding, when they are due back, and who reserved them.

advanced security

Module Highlights:

With the allure of money and drugs, casinos, pharmacies, banks and other high-stakes operations can be enticing environments for criminal behavior.

While video surveillance is certainly table-stakes in these markets, proxSafe's Advanced Security Module provides additional protection against theft and equipment tampering.

ADVANCED SECURITY

- 4 & 6-Eyes Principle
- Secure Return
- Special Reports
- Department Release
- keyTag Time Profiles with Email Alarmer

Applications like casinos, pharmacies, and banks require a higher level of security to protect money counting rooms, drug cabinets, and other high-value areas.

Whether you wish to restrict key access to specific individuals or allow anyone within a department to access keys, the Advanced Security Module lets you apply keyTag time profiles and restrictions which can trigger alarms should the approved duration be exceeded.

This module also includes a very powerful 4 & 6-Eyes feature, otherwise known as two-man or three-man rule, which will only release sensitive or restricted keys once the two or three required logins are approved. This type of rigorous oversight can also optionally be applied to key returns using a Secure Return mode which is configurable to allow any user to return a key (with proper log in), or require that the key requestor be the one to return it.

The Advanced Security module also supports our innovative Alarmer feature which can initiate other applications upon an event or an alarm. This is ideal for customers who may have video surveillance, access control, intrusion systems etc. and can be leveraged by the proxSafe system to provide a heightened level of security.

This module also includes optional Special Reports which provide valuable information such as late or incorrect key returns, or noncompliance with the 4 & 6-Eyes condition - information that is sometimes a requirement of drug or gaming agencies. For example, Nevada Gaming requirements call for maintenance of separate reports indicating the date, time, table game number, and reason an employee signs in or out a drop box key.

groups

Module Highlights:

proxSafe key management systems typically have very high usage – accessed daily by dozens or hundreds of employees, temporary workers, or contractors needed to keep a business running smoothly. Our Group Module lets you confidently organize staff into groups or departments where you can assign multiples of the same key sets.

Better manage groups of employees, temporary workers or contractors by releasing keytags based on specific group criteria. For example, assign a group of vehicle keyTags that will be released based on the least mileage giving you better control over fleet management. Or, to ensure proper key circulation, release an asset such as a battery charged radio with the longest retention in the cabinet.

You can even release one keyTag out of a keyTag group randomly, useful in facilities with housekeeping or maintenance teams where a specific keyTag doesn't necessarily matter – just that one from that assigned group is released. Similarly, you can release a group of keyTags immediately when a user from an assigned group is authenticated at a terminal. This mode is often used by fleet managers who wish to obtain an entire assigned set of keyTags needed by the team of drivers for that day.

The Group module gives you complete control over keyTag distribution, offering a 'one-time' mode where an authorized user is given one-time access to a keyTag, and a 'one user' mode, where keyTag rights are given exclusively to one user.

GROUPS

- Issue Code Logging
- Roaming keyTag
- One-time & Single User keyTag Assignments
- Immediate or Configurable Group Release

reports

Module Highlights:

Heavily regulated industries such as gaming, healthcare, or education are subject to many types of audits to ensure full compliance with regulations. proxSafe's Extended Reports Module provides an excellent way to deliver detailed representations of data, either through simple CSV exports or through special graphical reports.

ProxSafe's comprehensive reporting tool provides essential information to help improve processes, assure employee honesty and minimize security risks. Create custom reports and schedule them to run automatically and be emailed to management on a regular basis, or as needed for special audits.

Easy-to-read reports feature details such as inconsistent or late keyTag returns, noncompliance with the 4 & 6-Eyes condition, and important mileage and vehicle conditions. Reports can be displayed in a graphical representation of the key cabinet, providing auditors or management with an easy-to-understand illustration of important data.

Create reports and save criteria on Alarmer Module events that may have occurred with connected applications such as video surveillance, access control, or intrusion systems, and email, print or export in CSV format.

REPORTS

- CSV Export
 - Alarmer
 - Inconsistent Returns
 - Reservations via Key Cabinet GUI
 - Keytag Use History
 - User History
 - Asset Key Status
- ... and many more

alarmer

Module Highlights:

Often, a key management system is part of a larger integrated security system such as access control or video surveillance. The Alarmer Module lets you initiate many of these other applications upon an event or an alarm, providing an additional layer of security while increasing efficiency and response time.

ALARMER

- Initiates Another Application

ProxSafe's Alarmer Module provides the ultimate in interactivity with other security applications. The intelligent application can instantly initiate another app based on conditions you configure in the software.

For example, if an employee takes a specific key but does not return it in the designated time span, that employee can be denied egress by an access control system. Likewise, a video surveillance window can pop up on screen if someone tries to remove a key without complying with the 4 & 6-Eyes rule.

proxSafe's ability to connect with many interoperable systems helps customers get the most out their entire security environment. Use Alarmer as a standalone module with your proxSafe system to leverage connectivity across systems, or as part of the Advanced Security module where you can also access special reports on Alarmer activity.

integration

Module Highlights:

proxSafe provides very effective security as a standalone system or tightly integrated with other business applications. Using the powerful proxSafe Web Services, you can vastly extend the capabilities of your key management system by integrating with physical access control, video surveillance, intrusion, or other critical systems that keep your business running smoothly and personnel safe and productive.

ProxSafe Web Services allow you to create and use third-party web-based applications to integrate with proxSafe. Whether used by your in-house developer or a third-party solutions provider, proxSafe Web Services share business logic, data and processes across a network and can be added to a GUI such as a web page or executable program to offer additional functionality.

A powerful example of this extended functionality is with an integrated physical access control system (PACS), which allows you to combine the features of key and asset management with personnel and alarm management. Using an integrated system, an administrator can onboard a new employee through the PACS and assign him or her a department which automatically provides him the appropriate access levels and keyTags associated with those access levels – all in one place. This type of tightly interconnected solution eliminates duplicate data entry, which costs valuable administrative time and invites the possibility of data entry errors. It also allows you to customize workflows and interfaces so that users have access and visibility to only the groups and keyTags that are relevant to their day to day operation.

INTEGRATION

- Add Users from Integrated Applications
- Assign keyTags Based on Personnel Access Levels
- Manage Directly within Integrated Application GUI
- Available Integrations Include:
 - Software House C•CURE® 9000
 - Lenel OnGuard®
 - Maxxess
 - AMAG
 - Genetec
 - ...and others
